Fantasista’s unique four-part filler technology creates a strong, wear-resistant restorative with a chameleon-like ability to mimic the surrounding tooth shade.

Unparalleled translucency and ability to blend with shade of the surrounding tooth

Fantasista’s unique four-part filler technology creates a strong, wear-resistant restorative with a chameleon-like ability to mimic the surrounding tooth shade.

A STRONG, TOUGH RESTORATIVE THAT RESISTS FRACTURE

After your first few Fantasista restorations you’ll appreciate its superb aesthetic and handling qualities. But studies reveal its features super physica properties. Its high compressive and flexural strength plus high fracture energy means that a Fantasista restoration is crack resistant and chip resistant, even when used in partially stressed areas or under heavier loading.

Unmatched translucency and ability to blend with shade of the surrounding tooth

Fantasista’s proprietary strontium filler adjusted the refractive index to complement that of the resin matrix. The result is a restorative with a natural appearance that matches the surrounding tooth structure. Margins become invisible, and it’s ideal for the most demanding anterior or cosmetic cases. It provides the high strength, wear-resistance, and opacity needed for long-term performance under stress or wear.
